Democracies at risk? A forecasting analysis of regime type and the risk of **terrorist** attack.

摘要: How substantial is democracy as a cause of transnational **terrorist** attacks? Can our identification of democratic political systems help us to anticipate the flow of transnational **terrorism**? We seek to address these questions by analyzing data on transnational **terrorist** incidents from 1968 to 2007. We rely on receiver operating curves as a diagnostic tool to assess forecasting ability of various models of **terrorist** activity. Our analyses yield four central conclusions. First, our model of transnational **terrorism** provides a fairly strong basis for forecasting attacks—at least at the (relatively broad) level of the country-year. Second, while the overall forecasting capacity of this model is fairly strong, democracy adds very little to our capacity to forecast **terrorist** attacks relative to a parsimonious model that includes only distance and the prior history of **terrorism**. Collectively, these two variables perform about as well as a much more broadly specified model in forecasting **terrorist** attacks out of sample. Third, the model is highly redundant in a predictive sense. That is, many if not most of the other variables appear to provide similar information in terms of identifying **terrorist** attacks. Finally, we suggest that scholars focus on the development of more fine-grained and time-variant predictive indicators in order to improve our ability to forecast transnational **terrorism**.
